<b>A</b>	<b>About This Document</b>	<b>14</b>

## 1 Summary

Flow is a small syntax which parses the flowchart description explained in this document and translates it to the  $\text{\LaTeX}$  picture environment.

Flow acts as a filter, so a typical execution would be...

```
flow < myprog.flo > myprog.pic
```

...where myprog.flo is a plain text file containing a description of a flowchart, and myprog.pic will be a plain text file containing the body of a  $\text{\LaTeX}$  picture environment to draw the flowchart. Alternatively

```
flow inputFile or flow inputFile outputFile
```

may be used. VMS users see notes at end.

myprog.pic could either be inserted into a picture environment in a  $\text{\LaTeX}$  file with a text editor, or pulled in by the  $\text{\input}$  command as  $\text{\LaTeX}$  is run.

## 2 System requirements

Nothing in particular. Flow is in very plain C and should be portable to pretty much anything without alteration. Check beginning of file for defines if it gives trouble.

## 3 Distribution and Bug Reports

Flow is free software covered by the GPL. See the file COPYING for details. Email to [terry\\_n\\_brown@yahoo.com](mailto:terry_n_brown@yahoo.com) <sup>1</sup> with bug reports etc.

## 4 Flowchart description syntax

### 4.1 [indented text]

[indented text] indicates the command accepts zero or more line of text, these lines are identified by indentation. All lines after the command starting with either a space or a tab are assumed to be text for that command. The first line not starting with one of these characters is assumed to be the next command. Distributed code / executeables are case insensitive, but local compilations may vary.

---

<sup>1</sup>Please Contact me ([kurino@zaregoto.org](mailto:kurino@zaregoto.org)) for version +k-0.01 or later. I'm a japanese, so japanese comment is welcome. And please refer [github{\slash}kurino{\slash}flow](https://github.com/kurino/flow)[<https://github.com/kurino/flow>] too.

The flowchart is always “going” either up, down, left or right. The initial direction is down.

The flowchart description file is terminated either by an invalid command, a blank line, or the end of the file. Keywords are case sensitive.

The output from flow will appear inside a  $\text{\LaTeX}$  picture environment. The positioning of the picture can be adjusted with the second pair as usual for the picture environment.

`\unitlength` should be set for use with the picture environment, all the examples in this document use 2em (ie. put `\setlength{\unitlength}{2em}` at the top of the  $\text{\LaTeX}$  file). Smaller values make the boxes tighter around the text, larger values make them more open.

## 4.2 The Commands

### 4.2.1 Comment

```
% comment to end of line
```

If the first thing on a line is a `'%'` symbol the line is treated as a comment. Thanks to Joost Bruynooghe for adding this command.

### 4.2.2 Box

```
Box [x y]
[indented text]
```

Draws a text at the current position, including a line or arrow leading to it if appropriate. If `x` and `y` are specified, the size of the box (in `\unitlengths`), and all subsequent boxes, is set to these. The default size of a box is 4 by 2 `\unitlengths`.

```
Right
Box
  This is
  the first
  box.
Box 8 1
  And this is the second
```

### 4.2.3 Oval, Tilt and Text

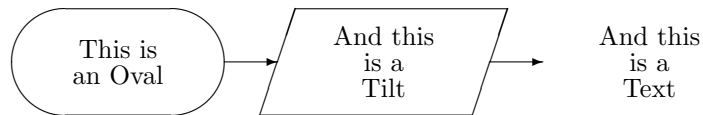

```
Oval [x y]
    [indented text]
```

```
Tilt [x y]
    [indented text]
```

```
Text [x y]
    [indented text]
```

Oval, Tilt and Text are identical to Box, except for the shape of the frame.  
(Text is an invisible frame.)

```
Right
Oval
    This is
    an Oval
Tilt
    And this
    is a
    Tilt
Text
    And this
    is a
    Text
```

#### 4.2.4 Choice

Choice A B C D [x y]  
[indented text]

Draws a choice diamond, with the corners labeled as illustrated by the left diamond in the example. Periods (.) are not printed. The optional x and y parameters alter the size of the choice. The default size is 4 by 4 \unitlengths. Flow will report an error for non-square choice boxes whose aspect ratio doesn't match one of the line slopes supported by L<sup>A</sup>T<sub>E</sub>X (-6 - 6 : -6 - 6, integers only).

Right  
Choice A B C D  
Label  
any  
corner  
Choice Yes . No .  
Normally  
only two.

#### 4.2.5 SetTrack, TexPos

SetTrack none | arrow | line

Use arrows, lines, or nothing for drawing connections between boxes.

TxtPos P1 P2 [B [A]]

P1 is the  $\text{\LaTeX}$  position specification (eg. [c] or [l]) for the lines of text that makes up the blocks of text in the boxes, P2 is the  $\text{\LaTeX}$  position specification for the whole block of text within the box. B is the string (no white space) to be placed before each line of text, A is the string to be placed after each line of text. The example shows the use of B to keep text off the edge of the box.

```
Right
SetTrack arrow
TxtPos [l] [l]
Box 3.5 2
  Needs some
  space on the
  left
TxtPos [l] [l] ~
Box
  Left justified
  text with
  space
SetTrack line
TxtPos [c] [c]
Box
  Centred
  Text
SetTrack none
TxtPos [r] [r] ~ \hspace*{1ex}
Box
  Right justified
  Text
```

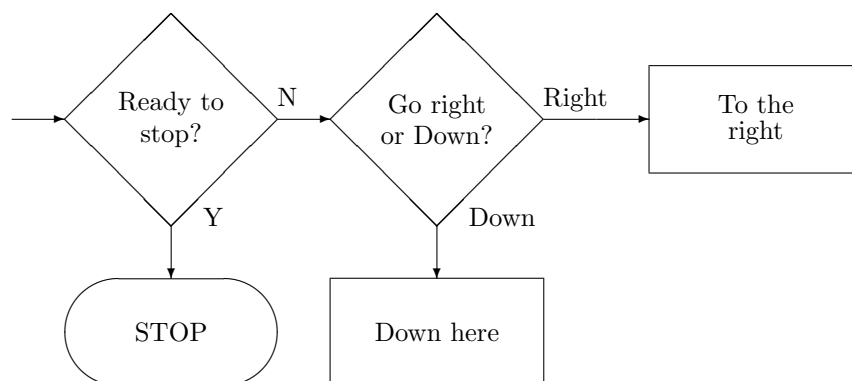

#### 4.2.6 Tag and ToTag

Tag

ToTag

Tag stores the location and size of the last object drawn on a stack, ToTag returns to that position (removing the item from the stack). This is particularly useful with Choices, allowing a second chain to be built from the diamond, but it can be used with any other item. Flow will complain if it encounters more ToTags the Tags, but won't mention Tags left on the stack when it finishes.

```
Right 0
Choice . . N Y
  Ready to
  stop?
Tag
Choice . . Right Down
  Go right
  or Down?
Tag
Right 1
Box
  To the
  right
ToTag
Down
Box
  Down here
ToTag
Down
Oval
  STOP
```

#### 4.2.7 Up, Down, Left and Right

Up [d [\*]]  
Down [d [\*]]  
Left [d [\*]]  
Right [d [\*]]

With or without the optional parameter, these command change the current direction of the flowchart. With the optional parameter, they draw a line, if SetTrack is line **or** arrow, or leave a gap, if SetTrack in none. The length of the line (or gap) is \$d\$. By default Boxes, Ovals, Tilts and Texts are 4 units wide and 2 units high. A Choice is 4 by 4 units. The arrows that connect things together are 1 unit. So a box drawn while the current direction is down would occupy  $2 + 1 = 3$  vertical units.

To force the line to end in a arrow head, use the “\*”, which must be separated from the “d” by a space.

Right 1  
Box  
    Flowing  
    along.  
Right 1  
Tag  
Down 2  
Left 6  
Up 2 \*  
ToTag  
Right 3  
Down  
Oval  
    STOP

#### 4.2.8 Scale

Scale x y

Scale the **next** item by the specified values

Right

Oval

Normal

Oval

Scale 2 1

Box

A smaller oval is a better stop

Scale 0.5 0.5

Oval

STOP

4.2.9 Skip

Skip x0 y0 x1 x1

x0	Horizontal separation between boxes, default 1 \unitlength
y0	Vertical separation between boxes, default 1 \unitlength
x1	Multiplier for Left and Right commands, default 1
y1	Multiplier for Up and Down commands, default 1

Skip 0 0 1 1  
SetTrack none  
Box  
    After this  
    Box  
Box  
    Is another  
    with no  
    gap  
SetTrack arrow  
Right 5  
Up 1 \*  
Left 1 \*  
Down 1 \*  
Right 1 \*  
Skip 0 0 3 3  
Up 1 \*  
Left 1 \*  
Down 1 \*  
Right 1 \*

## 5 VMS notes

I don't know much VMS, but this is one way of getting it to work. Compile and link as normal, then

```
flow := $[$1$DIA3:[brownt1.usr.flow]flow.exe
```

where the bit in the box is the name of the drive you're working on, and [brownt1.usr.flow] is the appropriate path. Then use the

```
flow infile outfile
```

form, as the redirection form doesn't seem to work.

## 6 An example

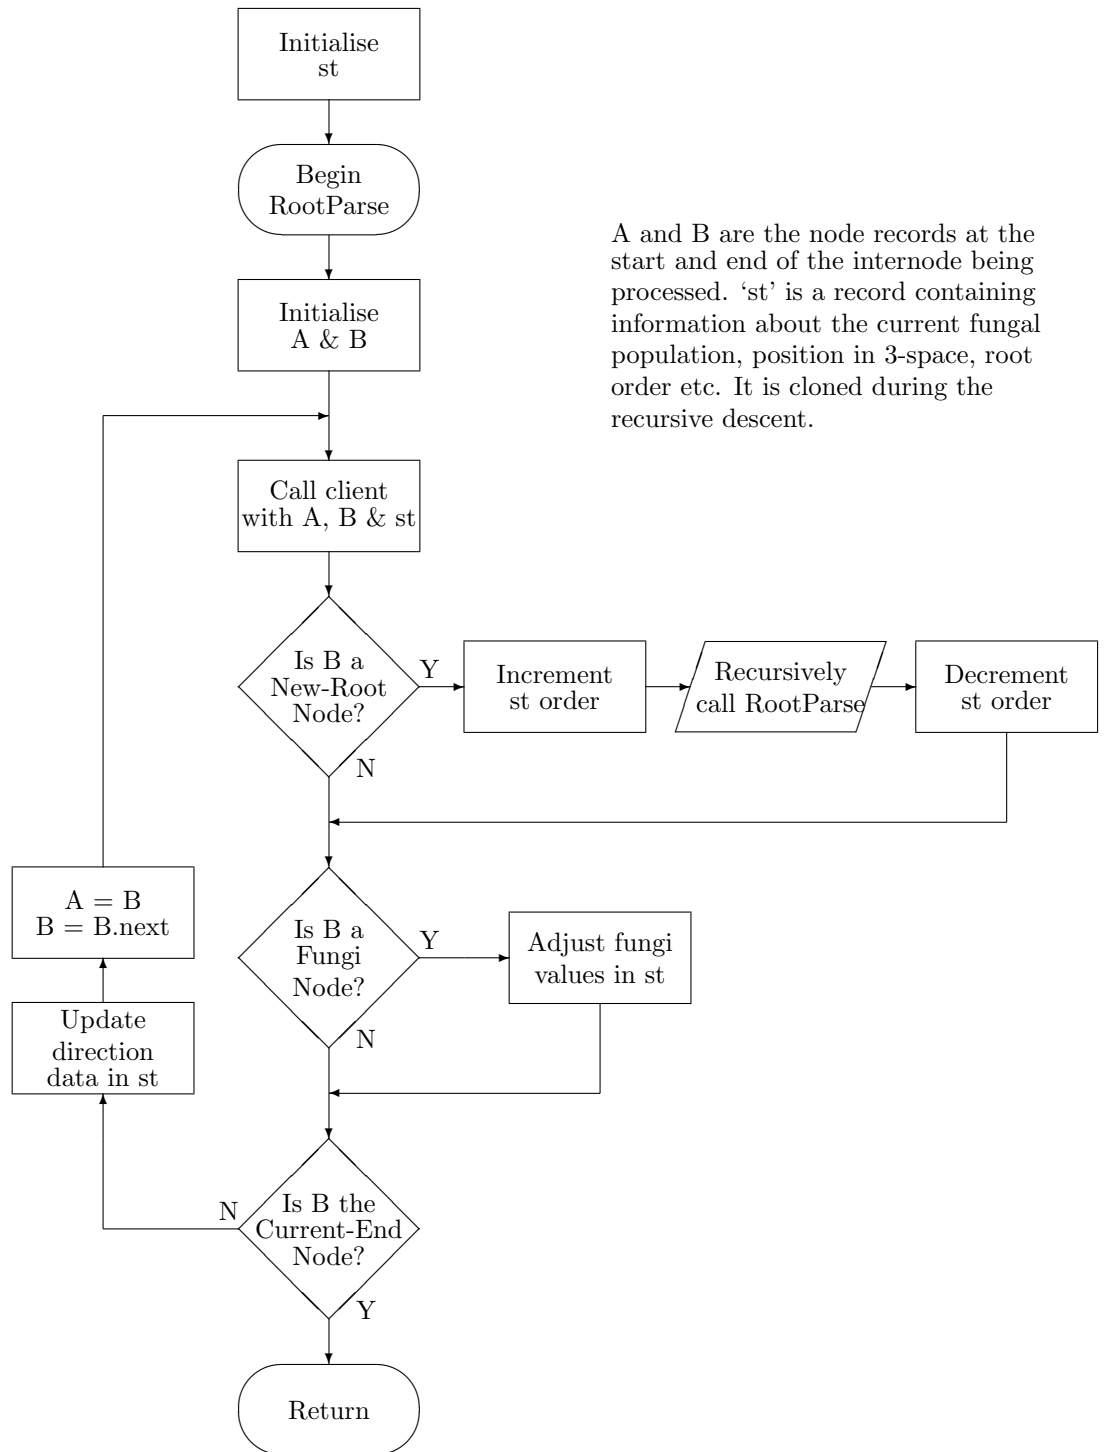

The instructions that generated this flow chart are included in a commented section in flowdoc.tex. Note the block of text is part of the picture environment (a Text).

```
% THIS IS THE FLOW DATA FOR THE EXAMPLE AT THE END
Box
  Initialise
  st
Oval
  Begin
  RootParse
Tag
Box
  Initialise
  A \& B
Down 1
Box
  Call client
  with A, B \& st
Choice . . Y N
  Is B a
  New-Root
  Node?
Tag
Down 1
Choice . . Y N
  Is B a
  Fungi
  Node?
Tag
Down 1
Choice . N . Y
  Is B the
  Current-End
  Node?
Tag
Oval
  Return
ToTag
Left 3
Up 2
Box
  Update
  direction
```

```

    data in st
Box
    A = B
    B = B.next
Up 10
Right 5 *
ToTag
Right 1
Box
    Adjust fungi
    values in st
Down 2
Left 6 *
ToTag
Right
Box
    Increment
    st order
Tilt
    Recursively
    call RootParse
Box
    Decrement
    st order
Down 2
Left 15 *
ToTag
SetTrack none
Down 2
Right 8
TxtPos [l] [c]
Text
    A and B are the node records at the
    start and end of the internode being
    processed. 'st' is a record containing
    information about the current fungal
    population, position in 3-space, root
    order etc. It is cloned during the
    recursive descent.

```

## A About This Document

Original of this document is “Flow — a syntax to generate flowcharts in the L<sup>A</sup>T<sub>E</sub>X picture environment<sup>2</sup>” by Terry Brown (C) 2005.

And for +k-0.01 version by S. Kurino (kurino@zaregoto.org).
